Project: Website For Photographer

Project Overview

This project aims to solve a real-world problem faced during weddings and events. Photographers capture many photos, but guests are unable to access them instantly.

The system provides a platform where:

- Photographers upload event photos
- Guests can directly access, view, and download photos using a link or event code

This improves accessibility, speed, and user experience.

Basic Functionality (Core Features)

1. Event-Based System

- Each wedding/event has a unique Event ID or link
- Photographer creates and manages events

2. Photo Upload

- Photographer uploads photos event-wise
- Supports bulk image upload

3. Guest Access (No Login Required)

- Guests can access photos using:
    - Event link
    - Event code

4. Photo Gallery

- Displays all event photos in grid format
- Fully mobile-friendly UI

5. Photo Download

- Guests can download photos directly
- Individual photo download supported

6. Search & Filter

- Search photos using tags or title
- Filter by category (ceremony, stage, etc.)

17/3/2026

Advanced Functionality (Future Enhancements)

1. Face Recognition

- Guest uploads selfie
- System shows only their photos

2. QR Code Access

- Generate QR code for each event
- Guests scan and open gallery instantly

3. Live Upload

- Photographer uploads photos in real-time during event

4. Favorites & Bulk Download

- Guests can select favorite photos
- Download multiple images at once

5. Password-Protected Gallery

- Secure access for private events

6. High-Quality Download Control

- Preview (low quality)
- Download (high quality)

7. Watermark System

- Watermark on preview images
- Removed on download

8. Performance Optimization

- Fast loading using CDN
- Lazy loading for images

17/3/2026

Tech Stack

Frontend

- React → Dynamic UI and component-based design
- HTML5, CSS3 → Structure and styling
- Tailwind CSS → Responsive and fast UI development
- JavaScript (ES6+) → API calls and event handling

Backend

- Node.js → Server-side logic
- Express.js → REST API development and routing

Database

- MongoDB → Stores:
    - Event details
    - Photo metadata (URL, tags, uploader)
- Mongoose → Schema modeling and validation

Cloud Storage

- Cloudinary OR
- Amazon S3

Used for:

- Storing images
- Fast delivery and optimization

Authentication & Security

- JWT (JSON Web Token) → Secure login for photographers
- Role-Based Access Control
- File validation (type & size)
- Secure API endpoints

API Design (Sample Endpoints)

- POST /create-event → Create event
- POST /upload-photo → Upload photos
- GET /photos/:eventId → Fetch event photos
- GET /download/:photoId → Download image

17/3/2026

Performance Optimization

- CDN for fast image delivery
- Lazy loading of images
- Image compression

Advanced Technologies (Future Scope)

- Face Recognition API
- QR Code Generator
- Real-time updates using WebSockets

Development Tools

- Git & GitHub → Version control
- Postman → API testing
- VS Code → Development environment

Existing System- Google Drive Photo Sharing

System Overview

Currently, many photographers use **Google Drive** to share wedding photos with clients and guests.

Workflow

1. Photographer uploads all photos to Google Drive
2. Creates a folder (e.g., “Rahul Wedding”)
3. Generates a shareable link
4. Sends the link via WhatsApp or email
5. Guests open the link and view/download photos

Advantages of Existing System

1. **Easy to Use**
    - Simple upload and sharing process
2. **Cloud Storage**
    - Stores large amounts of data
3. **Access Anywhere**
    - Guests can access photos from any device
4. **No Development Required**
    - Ready-made solution

Limitations of Existing System

1. No Personalization

- All photos are in one folder
- Guests must manually search for their photos

2. Poor User Experience

- Not designed for event-based photo browsing
- No proper gallery view (only file list/grid)

3. No Event Control

- No structured event system (codes, categories, etc.)
- Difficult to manage multiple events

4. No Smart Features

- No face recognition
- No filtering based on person

5. Limited Interaction

- No like, favorite, or selection option
- No user engagement features

6.Download Issues

- Bulk download is complex
- Sometimes requires login

7. Security Limitations

- Link sharing can be forwarded to anyone
- No proper access control
